

**Q1. Create a template from custom template type.**

Ans. Created a custom template named custom-template. Further i created a template Bootcamp from it.

**Q2. Create two templates T1 and T2 such that T1 is only allowed under hierarchy “/content/my-site/us” and T2 is only allowed under “/content/my-site/fr”.**

Ans. T1 is allowed only inside us page and T2 is allowed inside fr page.

**Q3. Add a component on a template such that the content (authored properties) of the component remains exactly same on all the pages created using that template.**

Ans. Added image component in the T1 template in the structure mode and created demopage1 under 'us' in the sites console. The page contains the image that i added in the structure mode and hence would be displayed on all the pages created from template T1.

**Q4. Add a parsys (responsive grid/layout container) in the above template such that author can add any component from group “General” on the page.**

Ans. I have added parsys in the above created templates using the policy title “firstpolicy” and only “General” group components can be drag onto the page.

**Q5. Define a component in such a way that content remains same on all pages created using a common template and the authored content can be reused on other templates as well without any re-authoring of the content.**

Ans. I had applied policy on the “image” component by naming the policy as “image policy” in template T1 and T2. I made a page demopage2 using T2 under the link “/content/templateexercise/fr”.

P.S I'm attaching the conf and content directories for the reference.
